I did not hear back from my team regarding communications and scheduling. Because there was no collaboration, I cannot really questions regarding teamwork.

My understanding of object-oriented programming feels more refined after working on the assignment. While I did learn from the resources provided in class, such as the textbook and LinkedIn videos, getting actual practice with solving problems using data structures helped me better recognize when and where to use different types of data structures. I also feel more comfortable making constructors to perform specific tasks than before working on the assignment. One challenge I encountered was figuring out how to make improvements to my code because I tend to set up a very basic code for the problem without accounting for later additions of code. This was not too big of a problem because I just added the code for improvements I wanted and figured out what I needed to fix based on the errors or outputs I received. The biggest challenge thus far was trying to get in contact with my team members because they do not seem to reply to emails and Canvas notifications. I tried providing my phone number so that they could text me, but I never heard back from them. I did what I could to communicate, but I was not able to resolve the issue of communicating with my team.
